

Featured Stories continuation...

My first 3 months at Oracle continuation...

within those products. Therefore, making Oracle's products much more competitive and providing a unique differentiator. However, none of this will be possible without high-quality and unique data.

As we approach the end of the year, I wanted to recognize the absolute monumental effort that the DataFox engineering team has been through transitioning DataFox to OCI and ODB. I hope that everyone is able to take some much-deserved rest and re-charge as we go into next year. I am looking forward to spending some time in the mountains skiing with my family this holiday season. The next 12 months will be crucial to the Product's future as we start to ship enhancements and new features, and I am highly optimistic about the path forward.

Meet the QA Automation (QAA) Team!

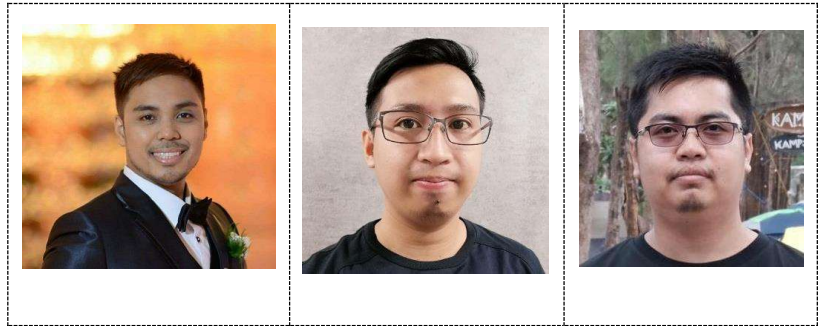

Written by Earl John Gallarde, Sr. Engineering Manager, QAA Team

Greetings from the Philippines!

Being in any enterprise of this sort, it goes without saying that we belong to the best of the best in the industry. I couldn't believe it myself, but it has been close to three months since my team, and I have joined Oracle Corporation. This just shows how dedicated everyone is to make sure that our clients are satisfied, making time pass by quickly as we've come to embrace work-life integration. Not to mention, it has been an extremely pleasant journey for us all throughout.

We are a group of QA Engineers based in Manila reporting to the Engineering org reporting to Jan Schiffman.

- Earl John Gallarde - worked for IBM and LexisNexis Risk Solutions
- Macnel Cayan - transferred from NetSuite; worked for Nokia and Macquarie.
- Rolf Antalan - worked for Accenture and SysGen RPO

We are projected to increase in number by January next year.

Our QAA Goal:

Center of Quality Assurance for everything AIA.

What we've started:

Our work mainly involves around software development, test automation, and Robotics Process Automation.

At this point in time, we are heavily involved with the automation of DataFox's post-deployment test. We have been working closely with the DataFox team headed up by Paul Mitchell's group and we're expected to expand our coverage to support FCS & HCM groups headed up by Andrew Rundell and Trevor Mathers respectively as we begin to add more QA resources. We've also begun exploring newer technologies and meeting with folks from DataFox's Product Team, Global Automation Technology (GAT), Security Testing as a Service (STaaS), and CIPaaS for the CI System Project.

As I end this short introduction, we wish everyone a happy holidays and we hope to work with you more in the future – that is, to learn from each other, to share experiences, and to bring joy and camaraderie to one and all – especially if we haven't done so yet!
